#### Detailed Description of the Invention

30

The compounds of the formula I of the present invention may be prepared according to the following general synthetic schemes, as well as relevant published literature procedures that are used by one skilled in the  
35 art. Exemplary reagents and procedures for these reactions appear hereinafter and in the working Examples. Protection and deprotection in the Schemes below may be

carried out by procedures generally known in the art (see, for example, Greene, T. W. and Wuts, P. G. M., *Protecting Groups in Organic Synthesis*, 3<sup>rd</sup> Edition, 1999 [Wiley]).

5           Scheme 1 describes a general synthesis of the amino acids described in this invention. An alcohol II ( $R^5(CH_2)_xOH$ ) (of which the most favored is 2-phenyl-5-methyl-oxazole-4-ethanol) is coupled with a hydroxy aryl- or heteroaryl- aldehyde III (preferably 3- or 4-  
10   hydroxybenzaldehyde) under standard Mitsunobu reaction conditions (e.g. Mitsunobu, O., *Synthesis*, **1981**, 1). The resulting aldehyde IV is then subjected to reductive amination using procedures known in the literature (e.g. Abdel-Magid et al, *J. Org. Chem.* **1996**, 61, 3849) with an  
15    $\alpha$ -amino ester hydrochloride V. PG in Scheme 1 denotes a preferred carboxylic acid protecting group, such as a methyl or tert-butyl ester. The resulting secondary amino-ester VI is then subjected to a second reductive amination using methods known in the literature (e.g.  
20   Abdel-Magid et al, *J. Org. Chem.* **1996**, 61, 3849) with an  $R^{3a}$  aldehyde VII. Final deprotection of the carboxylic acid ester under standard conditions known in the literature (Greene) utilizing basic conditions (for methyl esters) or acidic conditions (for tert-butyl  
25   esters) then furnishes the desired amino acid products ID.

          An alternative route to the aldehyde IV is shown in Scheme 1A. The alcohol II ( $R^5(CH_2)_xOH$ ) (of which the most favored is 2-[2-phenyl-5-methyl-oxazole-4-yl]-ethanol) is  
30   treated with methanesulfonyl chloride to give the corresponding mesylate VIII. The mesylate is then alkylated under standard basic conditions with a hydroxyaryl or hydroxyheteroaryl aldehyde III to furnish the aldehyde IV.

35           An alternative route to the amino acids IF is shown in Scheme 2. The secondary amino-ester VI is deprotected under standard conditions (basic conditions if the

protecting group (PG) is methyl; acidic conditions if PG is tert-butyl) to furnish the corresponding amino acid IE. Reductive amination with an  $R^{3a}$  aldehyde under analogous conditions as described in Scheme 1 furnishes the desired tertiary amino acid products IF.

Alternatively, as shown in Scheme 3, the tertiary amino acids IF may also be obtained by alkylation of the secondary amino-ester VI with an alkylating agent IX (with an appropriate leaving group (LG) such as halide, mesylate, or tosylate) under standard conditions known in the art followed again by standard deprotection of the carboxylic acid ester X to provide the amino acids IF.

As shown in Scheme 4, the tertiary amino acid IF may also be assembled through reductive amination first of the  $R^{3a}$  aldehyde XI with an appropriate amine ester hydrochloride V. The resulting secondary amine-ester XII then is subjected to reductive amination with the appropriate alkyl, aryl or heteroaryl aldehyde IV (as in Scheme 1) followed by deprotection of the carboxylic acid ester to give the desired amino acid analogs IF.

For further substituted amino acids, a general synthetic scheme is shown in Scheme 5. Reductive amination of an appropriate amine XIII with an aryl or heteroaryl aldehyde XIV under standard conditions furnishes the corresponding secondary amine XV, which is then reacted with a halide-ester XVI (e.g. tert-butyl bromoacetate) to furnish the corresponding  $\alpha$ -amino ester XVII. This amine-ester XVII is then deprotected under standard conditions to provide the desired amino acid analogs IF.

The synthetic route in Scheme 5 also provides a general scheme for the synthesis of the corresponding aminophosphonic acids IFA, as illustrated in Scheme 5a. The secondary amine XV is reacted with an appropriately protected halide-phosphonate XVIIA to provide the corresponding aminophosphonate ester XVIIIA, which is then deprotected under standard conditions (Greene & Wuts) to

furnish the amino phosphonic acid IFA. Scheme 5b illustrates the synthesis of the aminophosphinic acids IFB, which again involves the reaction of an appropriately protected halide-phosphinate ester XVIB with the secondary amine XV. Deprotection of the resulting aminophosphinate ester then provides the phosphinic acid IFB.

An alternative to the sequence in Scheme 5 is shown in Scheme 6. A hydroxyaryl or heteroaryl amine XVIII is selectively protected on nitrogen to provide protected amine XIX. A preferred  $R^5(CH_2)_nOH$  (II) is then reacted with XIX under Mitsunobu conditions to provide the corresponding ether, followed by deprotection of the amine, to form the free amine XX. The free amine XX is then activated with a standard activating group (2,4-dinitrobenzenesulfonamide; T. Fukuyama et al, *Tetrahedron Lett.* **1997**, 38, 5831) and is then treated with an  $\alpha$ -halo ester XVI as in Scheme 5. The 2,4 dinitrobenzenesulfonamide XXI is deprotected under literature conditions (T. Fukuyama et al, *Tetrahedron Lett.*, **1997**, 38, 5831) to furnish a secondary  $\alpha$ -amino-ester XXII which is then subjected to a reductive amination with an  $R^{3a}$  aldehyde XI followed by deprotection of the ester X to furnish the desired analogs IF.

Scheme 7 describes an alternative general route to the amino acid analogs IG. A hydroxyaryl or heteroaryl aldehyde III is subjected to the usual reductive amination conditions with an appropriate amine-ester hydrochloride V. The resulting secondary amine-ester XXIII is functionalized, in this case by a second reductive amination with an  $R^{3a}$  aldehyde VII to furnish the corresponding hydroxy tertiary amine-ester XXIV. This can now undergo a Mitsunobu reaction with a preferred alcohol II ( $R^5(CH_2)_nOH$ ) which followed by deprotection of the ester XXV furnishes the desired analogs IG.

Scheme 8 describes a general synthesis of diaryl and aryl-heteroaryl-substituted amino acid analogs IH. The secondary amine-ester XXII undergoes reductive amination with an appropriately substituted formyl phenyl boronic acid XXVI under standard conditions to give the corresponding tertiary amine-ester boronic acid XXVII. The aryl boronic acid XXVII can then undergo a Suzuki coupling (e.g. conditions as described in Gibson, S. E., *Transition Metals in Organic Synthesis, A Practical Approach*, pp. 47-50, 1997) with aryl or heteroaryl halides XXVIII (especially bromides) to furnish the appropriate cross-coupling diaryl products XXIX. Deprotection of the amine-ester XXIX generates the desired amino acid analogs IH.

Scheme 9 describes a general synthesis of diaryl and aryl-heteroaryl ether-substituted amino acid analogs IJ. The tertiary amine-ester boronic acid XXVII which is described in Scheme 8 can be coupled with appropriately substituted phenols XXX under literature conditions (D. A. Evans et al, *Tetrahedron Lett.*, **1998**, 39, 2937) to furnish the appropriate diaryl or aryl-heteroaryl ethers XXXI, which after deprotection afford the desired amino acid analogs IJ.

Alternatively, as shown in Scheme 10, reductive amination of the secondary amine-ester XXII with an appropriately substituted hydroxyaryl or hydroxyheteroaryl aldehyde XXXII furnishes the corresponding phenol-tertiary amine-ester XXXIII. The phenol XXXIII can then undergo coupling with appropriate aryl or heteroaryl boronic acids XXXIV under literature conditions (D. A. Evans et al, *Tetrahedron Lett.*, **1998**, 39, 2937) to furnish the corresponding diaryl or arylheteroaryl ether-amino esters XXXI. The desired analogs IJ are then obtained after deprotection of the amine-ester XXXI.

Scheme 11 illustrates the synthesis of the carbamate-acid analogs IK. The secondary amine-ester

XXII can be reacted with appropriate chloroformates XXXV under standard literature conditions (optimally in  $\text{CH}_2\text{Cl}_2$  or  $\text{CHCl}_3$  in the presence of a base such as  $\text{Et}_3\text{N}$ ) to furnish the corresponding carbamate-esters. The  
5 requisite analogs IK are then obtained after deprotection of the carbamate-ester. Alternatively, the secondary amine-ester XXII can be reacted with phosgene to generate the corresponding carbamyl chloride XXXVI. This carbamyl chloride intermediate XXXVI can be reacted with  $\text{R}^{3a}\text{-OH}$   
10 (XXXVII) (optimally substituted phenols) to afford the corresponding carbamate-acids IK after deprotection.

Scheme 12 illustrates the further functionalization of aryl carbamate-acid analogs IK. The secondary amine-ester XXII is reacted with an aryl chloroformate XXXVIII  
15 (containing a protected hydroxyl group) to form XXXIX. The hydroxyl group is then selectively deprotected in the presence of the ester functionality to provide XL, then alkylated with an appropriate  $\text{R}^6\text{-LG}$  (XLI) (where LG is halide, mesylate or tosylate, and  $\text{R}^6$  is most preferably  
20  $\text{CHF}_2\text{-}$ , or  $\text{CH}_3\text{CH}_2\text{-}$ ) in the presence of base. Deprotection of the ester then furnishes the desired carbamate-acid analogs IL.

The secondary amine-ester XXIIA can be functionalized with substituted aryl or aliphatic  
25 carboxylic acids XLII, under standard peptide coupling conditions, as illustrated in Scheme 13. The amide bond-forming reactions are conducted under standard peptide coupling procedures known in the art. Optimally, the reaction is conducted in a solvent such as DMF at  $0^\circ\text{C}$  to  
30 RT using 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide (EDAC or EDCI or WSC), 1-hydroxybenzotriazole (HOBT) or 1-hydroxy-7-azabenzotriazole (HOAT) and a base, for example Hunig's base (diisopropylethylamine), N-methyl morpholine or triethylamine. Deprotection of the amide-  
35 ester then furnishes the desired amide-acid analogs IM.

The secondary amine-ester XXIIA can also be reacted with aliphatic or aryl isocyanates XLIII to provide the

corresponding urea-esters. Deprotection of the urea-ester provides the desired urea-acid analogs IN, as shown in Scheme 14. Alternatively, as shown in Scheme 15, the carbamyl chloride intermediate XXXVI described in Scheme 11 can be reacted with appropriate aliphatic or aryl amines XLIV in the presence of a tertiary amine (e.g. Et<sub>3</sub>N) to furnish tri- or tetrasubstituted urea-acid analogs IO or IP after deprotection of the ester.

The secondary amine-ester XXIIA can also be reacted with appropriate sulfonyl chlorides XLVI under standard literature conditions (optimally in the presence of a base such as pyridine, either neat or using chloroform as a co-solvent), followed by deprotection, to provide the corresponding sulfonamide-acids IQ, as shown in Scheme 16.

Replacement of the carboxylic acid functionality in these analogs with tetrazole can be achieved as shown in Scheme 17. An acid analog IK is coupled with an amine (containing an appropriate tetrazole protecting group) XLVII (preferably 3-amino propionitrile) under standard peptide coupling conditions. The resulting secondary amide XLVIII is then subjected to a Mitsunobu reaction under standard conditions with trimethylsilyl azide (TMSN<sub>3</sub>) to form the protected tetrazole XLIX. Deprotection of the cyanoethyl group is achieved preferentially in the presence of base to generate the desired free tetrazole analog IR.

Scheme 18 describes a general synthesis of the hydrazide-acid analogs IS. A substituted aryl carboxylic acid 1 is treated with methanesulfonyl chloride in the presence of base; the intermediate is then reacted with a protected hydrazine-ester VA to give the corresponding acylated hydrazine 1a (ref: *Synthesis*, 1989, 745-747). The acylhydrazine 1a is coupled with an appropriately substituted aryl aldehyde IV under reductive amination conditions to give the corresponding protected hydrazide ester 3 (ref: *Can. J. Chem.*, 1998, 76, 1180-1187).

Deprotection of the ester 3 then furnishes the hydrazide-acid analogs IS.

An alternative synthetic approach to hydrazide-acids IS is shown in Scheme 19. An aryl aldehyde IV can  
5 be reduced to the corresponding alcohol under standard conditions (e.g.  $\text{NaBH}_4$ ). This alcohol is then converted to the corresponding bromide 4 using standard conditions (e.g.  $\text{Ph}_3\text{P/CBr}_4$  or  $\text{PBr}_3$ ). The bromide 4 is then reacted with the hydrazine-ester 1a (ref: *Tetrahedron Lett.*,  
10 1993, 34, 207-210) to furnish the protected hydrazide-ester 3, which is then deprotected to give the hydrazide-acid analogs IS.

The different approaches to the preparation of the  $\alpha$ -alkylbenzyl amino acid and carbamate-acid analogs IT  
15 and IU are exemplified in the following synthetic schemes. In Scheme 20 an appropriately substituted aryl aldehyde IV is treated with a suitable organometallic reagent (e.g. a Grignard reagent  $\text{R}^{10}\text{MgBr}$ ) under standard conditions to give the corresponding secondary alcohol,  
20 which is then oxidized under standard conditions (e.g. Swern oxidation with  $(\text{COCl})_2/\text{DMSO}/\text{Et}_3\text{N}$  or using pyridinium chlorochromate) to give the corresponding ketone 5. Reductive amination of the ketone 5 with an appropriately substituted amino-ester 6 provides the corresponding  $\alpha$ -  
25 alkylbenzyl amino-ester 7. It will be understood that in

the amino ester 6, the moiety  does not necessarily represent two repeating units.

Acylation of amino-ester 7 with an appropriately substituted aryl or heteroaryl chloroformate XXXV  
30 followed by deprotection provides the racemic carbamate-acid analogs IT. Reductive amination of alkylbenzyl amino-ester 7 with aryl aldehyde VII followed by deprotection provides the racemic amino-acid analogs IU.

Alternatively, as shown in Scheme 21, asymmetric  
35 reduction (e.g. using the Corey oxazaborolidine reduction protocol; review: E. J. Corey & C. Helal, *Angew. Chem.*

*Int. Ed. Engl.*, 1998, 37, 1986-2012.) of the aryl-ketone 5 provides each of the desired enantiomeric alcohols 8 (although only one enantiomer is represented in the scheme). Treatment of the chiral alcohol 8 with azide in a Mitsunobu-like reaction (ref: A. S. Thompson et. al., *J. Org. Chem.* 1993, 58, 5886-5888) gives the corresponding chiral azide (with inverted stereochemistry from the starting alcohol). The azide is then converted to the amine 9 by standard reduction methods (e.g. hydrogenation or  $\text{Ph}_3\text{P}/\text{THF}/\text{H}_2\text{O}$ ). Treatment of the chiral amine 9 with an ester XVIA (containing an appropriate leaving group) provides the secondary amino-ester 10. Acylation of amino-ester 10 with an aryl or heteroaryl chloroformate XXXV followed by deprotection provides the chiral carbamate-acid analogs ITa (which may be either enantiomer depending upon the stereochemistry of 8). Reductive amination of alkyl amino-ester 10 with aryl aldehydes VII followed by deprotection provides the chiral amino-acid analogs IUa (which may be either enantiomer depending upon the stereochemistry of 8).

An alternative to Scheme 21 is shown in Scheme 22. An appropriately protected oxyaryl ketone 11 undergoes asymmetric reduction to give the chiral alcohol 12. This is converted to the chiral amine 13 via the identical sequence as in Scheme 21 (via the chiral azide). Treatment of the chiral amine 13 with an ester XVIA (LG = halogen or mesylate) gives the corresponding secondary amino-ester 14. Acylation of 14 with an aryl or heteroaryl chloroformate XXXV provides the corresponding carbamate-ester. Selective deprotection furnishes the free phenol carbamate-ester 15. Alkylation of the phenol 15 with a halide or mesylate VIII followed by deprotection provides the carbamate-acid analogs ITa. An analogous sequence (involving reductive amination of the secondary amino-ester 14 with an aryl or heteroaryl aldehyde VII, then selective deprotection, alkylation

with VIII and a final deprotection) provides the amino acid analogs IUa.

It will be appreciated that either the (R)- or (S)- enantiomer of ITa or IUa may be synthesized in Schemes 21 and 22, depending upon the chirality of the reducing agent employed.

A fourth synthetic sequence is shown in Scheme 23. The substituted aldehyde IV is condensed with an amino-ester hydrochloride 6 to give the corresponding imine 16, which is then treated in situ with an appropriately substituted allylic halide 17 in the presence of indium metal (reference: Loh, T.-P., et al., *Tetrahedron Lett.*, 1997, 38, 865-868) to give the  $\alpha$ -allyl benzyl amino-ester 18. Acylation of amine 18 with an aryl or heteroaryl chloroformate XXXV followed by deprotection provides the carbamate-acid analogs Iv. Reductive amination of alkyl amino-ester 18 with an aryl or heteroaryl aldehyde VII followed by deprotection provides the amino-acid analogs IW.

Scheme 24 shows the preparation of the required intermediate 2-aryl-5-methyl-oxazol-4-yl methyl chloride 21 (following the general procedure described in Malamas, M. S., et al, *J. Med. Chem.*, 1996, 39, 237-245). A substituted aryl aldehyde 19 is condensed with butane-2,3-dione mono-oxime under acidic conditions to give the corresponding oxazole N-oxide 20. Deoxygenation of the oxazole N-oxide 20 with concomitant chlorination furnishes the desired chloromethyl aryl-oxazoles 21. Hydrolysis of chloromethyl oxazole 21 under basic conditions furnishes the corresponding oxazole-methanol 22. Oxidation of alcohol 22 to the corresponding aldehyde is followed by conversion to the corresponding dibromoalkene 23 (e.g.  $\text{Ph}_3\text{P/CBr}_4$ ). The dibromide 23 is converted to the corresponding alkynyl-lithium species (using an organolithium reagent such as n-BuLi), which can be reacted in situ with an appropriate electrophile such as formaldehyde to give the corresponding acetylenic

alcohol (ref: Corey, E. J., et al., *Tetrahedron Lett.* 1972, 3769, or Gangakhedkar, K. K., *Synth. Commun.* 1996, 26, 1887-1896). This alcohol can then be converted to the corresponding mesylate 24 and alkylated with an appropriate phenol 25 to provide analogs IX. Further stereoselective reduction (e.g. H<sub>2</sub>/Lindlar's catalyst) provides the E- or Z- alkenyl analogs IV.

Scheme 25 describes a general synthesis of the amino-benzoxazole analogs IZ (general ref: Sato, Y., et al, *J. Med. Chem.* 1998, 41, 3015-3021). An appropriately substituted ortho-aminophenol 26 is treated with CS<sub>2</sub> in the presence of base to furnish the corresponding mercapto-benzoxazole 27. Treatment of this thiol 27 with an appropriate chlorinating agent (e.g. PCl<sub>5</sub>) provides the key intermediate chlorobenzoxazole 28, which is reacted with the secondary amino-ester VI to furnish, after deprotection, the amino benzoxazole-acid analogs IZ.

The thiazole analogs IZa were synthesized according to the general synthetic route outlined in Scheme 26 (ref: Collins, J. L., et al., *J. Med. Chem.* 1998, 41, 5037). The secondary amino-ester XXIII is reacted with an aryl or heteroaryl chloroformate XXXV in the presence of an appropriate base (e.g. pyridine or triethylamine) to furnish the corresponding hydroxyaryl carbamate-ester 29. The hydroxyaryl ester 29 is then reacted with an appropriately substituted  $\alpha$ -bromo vinyl ketone 29a (for S<sub>1</sub> = CH<sub>3</sub>, e.g. Weyerstahl, P., et. al., *Flavour Fragr. J.*, 1998, 13, 177 or Sokolov, N. A., et al., *Zh. Org. Khim.*, 1980, 16, 281-283) in the presence of an appropriate base (e.g. K<sub>2</sub>CO<sub>3</sub>) to give the corresponding Michael reaction adduct, the  $\alpha$ -bromoketone carbamate-ester 30. The  $\alpha$ -bromoketone 30 is then subjected to a condensation reaction with an appropriately substituted aryl amide 31 (A = O) or aryl thioamide 31 (A = S) to furnish either the corresponding oxazole (from the amide) or the thiazole (from the thioamide) (ref: Malamas, M. S., et al, *J. Med. Chem.*, 1996, 39, 237-245). Finally,

deprotection of esters 31 then provides the substituted oxazole and thiazole carbamate acid analogs IZa.

It will be appreciated that in the following schemes where the carbamate-acid analogs are prepared, the corresponding amino acid analogs may also be prepared by replacing the chloroformate reaction with an aldehyde in a reductive amination reaction (as in Scheme 20 with intermediate amine 7).

Scheme 27 describes a general synthesis of the acids IZb and IZc. A halo-substituted aryl aldehyde 32 (preferably iodide or bromide) is subjected to reductive amination using procedures known in the literature (e.g. Abdel-Magid et al, *J. Org. Chem.* 1996, 61, 3849) with an  $\alpha$ -amino acid ester hydrochloride V. The resulting secondary amino-ester 33 is then reacted with an aryl or heteroaryl chloroformate XXXV in the presence of an appropriate base (e.g. pyridine or triethylamine) to furnish the corresponding halo-aryl carbamate-ester 34. Aryl halide 34 is then reacted with an appropriate aryl- or heteroaryl-substituted acetylene 35 (the preferred acetylene being 5-phenyl-2-methyl-oxazol-4-yl-methylacetylene) in the presence of an appropriate palladium catalyst (e.g.  $(\text{Ph}_3\text{P})_2\text{PdCl}_2$ ) and a copper (I) salt (e.g. CuI) in a Sonogashira coupling reaction (ref: Organocopper Reagents, a Practical Approach, R. J. K. Taylor, Ed., Chapter 10, pp 217-236, Campbell, I. B., Oxford University Press, 1994) to furnish the key intermediate, arylacetylene carbamate ester 36.

The arylacetylene ester 36 is deprotected to provide the corresponding arylacetylene acid analogs IZb. The acetylene moiety of 36 can be reduced by standard methods (e.g. hydrogenation, ref: M. Hudlicky, *Reductions in Organic Chemistry*, 2<sup>nd</sup> Edition, ACS, 1996, Chapter 1) to furnish the corresponding fully saturated alkyl aryl carbamate ester, which is then deprotected to give the alkyl aryl carbamate acid analogs IZc.

Stereoselective reduction of the acetylene ester 36 by standard methods (e.g. Lindlar's catalyst; ref: Preparation of Alkenes, A Practical Approach, J. J. Williams, Ed., Chapter 6, pp 117-136, Oxford University Press, 1996) can be achieved to provide the corresponding cis-alkenyl aryl carbamate-ester, which is then deprotected to furnish the Z-alkenyl aryl carbamate acid analogs IZd (Scheme 28). Alternatively, this sequence can be reversed, i.e. the initial step being the deprotection of acetylenic ester 36 to the acetylenic acid, followed by stereoselective reduction of the acetylene moiety to provide the Z-alkene-acid analogs IZd.

The corresponding trans-alkenyl aryl carbamate acids IZe can be synthesized according to the general route in Scheme 29. An aryl- or heteroaryl-acetylene 35 (the preferred moiety again being 5-phenyl-2-methyl-oxazol-4-yl-methylacetylene) is halogenated under standard conditions (ref: Boden, C. D. J. et al., *J. Chem. Soc. Perkin Trans. I*, 1996, 2417; or Lu, W. et al., *Tetrahedron Lett.* 1998, 39, 9521) to give the corresponding halo-acetylene, which is then converted to the corresponding trans-alkenyl stannane 37 (ref: Boden, C. D. J., *J. Chem. Soc., Perkin Trans. I*, 1996, 2417). This aryl- or heteroaryl-substituted trans-alkenyl stannane 37 is then coupled with the halo-aryl carbamate ester 34 under standard Stille coupling conditions (ref: Farina, V. et. al., "The Stille Reaction", *Organic Reactions*, 1997, 50, 1) to furnish the corresponding trans-alkenyl aryl carbamate ester 38. This carbamate-ester is then deprotected under standard conditions to give the desired trans-alkenyl aryl carbamate acid analogs IZe.

The corresponding cyclopropyl analogs IZf and IZg are synthesized according to Scheme 30. For the cis- or (Z-) cyclopropyl analogs, stereoselective reduction ( $H_2$ /Lindlar's catalyst) of the alkynyl moiety of intermediate

alknyl ester 36 (as for analogs IZd), followed by  
cyclopropanation under standard conditions (Zhao, Y., et  
al, *J. Org. Chem.* 1995, 60, 5236-5242) and finally  
deprotection provides the cis-cyclopropyl carbamate-acid  
5 analogs IZf. For the trans-cyclopropyl analogs IF,  
analogous cyclopropanation of the E-alkene moiety of  
intermediate 38 followed by deprotection provides the  
trans-cyclopropyl carbamate-acid analogs IZg.

- 15 To a 0°C solution of 4-hydroxybenzaldehyde (1.70 g, 12.3 mmol), 5-phenyl-2-methyl-oxazole-4-ethanol (Maybridge; 2.50 g, 14.0 mmol) and Ph<sub>3</sub>P (4.20 g, 16.0 mmol) in dry THF (30 mL) was added dropwise DEAD (3.20 g, 15.0 mmol). The solution was stirred at 0°C for 0.5 h, then was allowed to warm to RT and stirred overnight. The orange-red solution was concentrated *in vacuo* and the residue was chromatographed (stepwise gradient from 5:1 to 5:2 hex:EtOAc) to give Part A compound (2.47 g, 65%) as a clear, slightly yellow viscous oil.

A1. Alternative Procedure for Preparing Part A Aldehyde

- 30 (1)

To a  $-5^{\circ}\text{C}$  solution of 5-phenyl-2-methyl-oxazole-4-ethanol (20.00 g, 0.098 mol) in  $\text{CH}_2\text{Cl}_2$  (100 mL) was added methanesulfonyl chloride (12.40 g, 0.108 mol) in one portion (exothermic reaction). After recooling to  $-5^{\circ}\text{C}$ ,  
5  $\text{Et}_3\text{N}$  (11.1 g, 0.110 mol) was added slowly over 30 min (internal temperature  $<3^{\circ}\text{C}$ ). The reaction was allowed to warm to RT and stirred for 1 h (reaction monitored by analytical HPLC), at which point starting material had been consumed. The reaction was washed with aqueous  $\text{HCl}$ .  
10 (2 x 50 mL of a 3N solution). The combined aqueous layers were extracted with  $\text{CH}_2\text{Cl}_2$  (50 mL). The combined organic extracts were successively washed with satd. aqueous  $\text{NaHCO}_3$  and brine (50 mL each), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated to ~30 mL volume. Methyl tert-butyl ether  
15 (120 mL) was added and the mixture was stirred; a white solid was formed. The mixture was cooled to  $-20^{\circ}\text{C}$  for complete crystallization. The product was filtered and vacuum-dried to give the product mesylate (23.3 g, 85%) as a white solid. The mother liquor was concentrated in  
20 vacuo and recrystallized from methyl tert butyl ether/heptane to give a second crop of product mesylate (3.3 g, 12%; total yield = 97%).

25

A mixture of the above mesylate (13.6 g, 0.048 mol), 4-hydroxybenzaldehyde (7.09 g, 0.058 mol) and  $\text{K}_2\text{CO}_3$  (9.95  
30 g, 0.072 mol) in DMF (110 mL) was heated at  $100^{\circ}\text{C}$  for 2 h (reaction complete by analytical HPLC). The mixture was allowed to cool to RT and then poured into ice-water (400 mL) and stirred for 30 min. The solid product was filtered and washed with cold water (3 x 25 mL) and dried  
35 in vacuo at  $50^{\circ}$ - $60^{\circ}\text{C}$  overnight. The crude product was

crystallized from MTBE-Hexane to give (12.2 g, 82%; 2 crops) the aldehyde (Part A1 compound) as a white solid.

To a solution of N-benzyl glycine ethyl ester (43 mg; 0.22 mmol) and Part A1 compound (52 mg; 0.17 mmol) in DCE (10 mL) was added  $\text{NaBH}(\text{OAc})_3$  (56 mg; 0.26 mmol). The reaction mixture was stirred vigorously overnight for 12 hours. Saturated aqueous  $\text{NaHCO}_3$  (10 mL) was added, and the mixture was extracted with EtOAc (3x 10 mL). The combined organic extracts were washed with brine, dried ( $\text{Na}_2\text{SO}_4$ ), concentrated *in vacuo* and chromatographed (hex:EtOAc 4:1) to give Part B compound (45 mg; 55%) as a pale yellow oil in addition to recovered starting material (14 mg; 27%).

20

C.

To a solution of Part B compound (45 mg) in MeOH (2 mL) was added aqueous NaOH (3 mL of a 1M solution). The solution was stirred overnight for 14 h and then acidified to pH 5 with excess aqueous HCl (1M solution). The mixture was extracted with EtOAc (2 x 10 mL); the combined organic extracts were washed with brine, dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated *in vacuo* to give the desired acid which was still contaminated with starting material. This mixture was dissolved in MeOH (2 mL) and aqueous

NaOH (3.0 mL of a 1M solution) and the resulting solution was refluxed for 1.5 h. Acidic extractive workup as above gave the desired title compound as a colorless solid (28 mg; 71%).  $[M + H]^+ = 457.2$

Flash chromatography (stepwise gradient from 7:3 to 2:3 hex: EtOAc) gave 35 mg (21%) of the dibenzyl glycine ester (Example 2 Part A compound). In addition, 127 mg (67%) of the monobenzyl glycine ester (Example 3 Part A compound) was obtained.

A.

To a mixture of the amino-tert-butyl ester (0.339 g, 0.80 mmol),

(prepared as described in Example 7, Part B), 4-hydroxybenzaldehyde (0.127 g, 1.03 mmol) and NaBH(OAc)<sub>3</sub> (0.510 g, 2.4 mmol) was added 7 drops of HOAc. The reaction was stirred at RT for 16 h. The mixture was diluted with EtOAc, then washed with aqueous NaHCO<sub>3</sub>. The organic phase was dried (MgSO<sub>4</sub>) and concentrated *in vacuo*. The crude product was chromatographed (SiO<sub>2</sub>; hexanes/EtOAc 3:1 to 1:4) to provide the 4-hydroxybenzyl amino ester title compound compound (0.381 g, 90%).

B.

5

The title compound was prepared as part of a solution phase library run using the following exemplary procedure.

To a solution of Part A phenol compound (30 mg, 0.057 mmol) in  $\text{CH}_2\text{Cl}_2$  (1 mL) was added 3-fluorophenyl boronic acid (12 mg; 0.086 mmol) and 4A molecular sieves (pre-dried at  $400^\circ\text{C}$  overnight) at RT. After stirring for 5 min,  $\text{Cu}(\text{OAc})_2$  (1 eq),  $\text{Et}_3\text{N}$  (5 eq) and pyridine (5 eq) were added to the mixture. The vial was capped and air was allowed to pass into the reaction. The reaction was stirred at RT for 60 h and was complete by analytical HPLC and LC/MS. (For other reactions which were incomplete after this time, additional boronic acid (1.5 equivalent) was added in order to form additional desired product). The reaction mixture was filtered and concentrated *in vacuo*.

The product was purified via solid-phase extraction using a United Technology SCX column (2 g of sorbent in a 6 mL column) by the procedure outlined below.

25

1) The column was conditioned with MeOH (10 mL) and  $\text{CH}_2\text{Cl}_2$  (10 mL)

2) The residue was dissolved in a minimal volume of  $\text{CH}_2\text{Cl}_2$  and loaded onto the SCX column.

30

3) The cartridge was successively washed with  $\text{CH}_2\text{Cl}_2$  (20 mL),  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  (20% MeOH, 20 mL) and MeOH (20 mL)

4) The product was eluted with a solution of 0.5N  $\text{NH}_3$  in MeOH.

- 5 The product-containing fractions were concentrated *in vacuo* to give the desired tert-butyl ester. (Some incomplete reactions required chromatography (on  $\text{SiO}_2$ ) of the crude material to give esters of the requisite purity). The t-butyl ester was treated with a solution of 30% TFA in  $\text{CH}_2\text{Cl}_2$  overnight. Volatiles were removed and the residue was redissolved in  $\text{CH}_2\text{Cl}_2$  (1 mL) and concentrated *in vacuo* on a Speed Vac to afford the desired title product (30 mg; 77%). Reverse phase HPLC analysis indicated that the product purity was 90%. In addition LC/MS gave the correct molecular ion  $[(\text{M}+\text{H})^+ = 567]$  for the desired title compound.

The vial was capped and air was allowed to pass into the reaction, which was stirred at RT for 24 h. The reaction mixture was filtered through a pad of Celite and concentrated *in vacuo*.

The product was purified via solid-phase extraction using a United Technology SCX column (2 g of sorbent in a 6 mL column) by the procedure outlined below.

1) The column was conditioned with MeOH (10 mL) and CH<sub>2</sub>Cl<sub>2</sub> (10 mL)

Example 125

5           A.

A solution of Example 7 Part A aldehyde (60 mg; 0.20  
10 mmol) and (S)- $\alpha$ -methyl benzylamine (30 mg; 0.24 mmol) in  
MeOH (1 mL) was stirred at RT for 6 h. The solution was  
cooled to 0°C and a pre-formed solution of NaBH<sub>4</sub> (9 mg;  
0.24 mmol) in MeOH (0.5 mL) was added portionwise. The  
reaction was stirred at RT overnight, then concentrated  
15 *in vacuo* without heating. The residue was partitioned  
between aqueous NaHCO<sub>3</sub> and EtOAc (5 mL each). The  
aqueous layer was extracted with EtOAc (2 x 5 mL). The  
combined organic extracts were dried (Na<sub>2</sub>SO<sub>4</sub>) and  
concentrated *in vacuo* to give title compound as an orange  
20 yellow-oil (81 mg crude).

B.

25

A solution of the Part A compound (70 mg; 0.17  
mmol), tert-butyl bromoacetate (66 mg; 0.34 mmol), and  
iPr<sub>2</sub>NEt in DMF (0.5 mL) was stirred at RT for 2 days.  
LC/MS showed that the reaction was complete and clean.

The crude reaction mixture was partitioned between H<sub>2</sub>O (30 mL) and EtOAc (20 mL). The aqueous layer was extracted with Et<sub>2</sub>O (2 x 10 mL); the combined organic extracts were dried (MgSO<sub>4</sub>) and concentrated *in vacuo* to give the crude amino-tert-butyl ester.

This crude product was stirred in a 1:1 solution of CHCl<sub>3</sub> and TFA (2 mL) for 18 h at RT. The solution was then concentrated *in vacuo* and purified by preparative reverse-phase HPLC (as in Example 10). The purified material was lyophilized from MeOH-H<sub>2</sub>O to give the title compound (71 mg; 71%) as a white lyophilate. [M + H]<sup>+</sup> = 471.2

#### Example 126

15

The title compound was synthesized following the same procedure as described above in Example 125 except that (S)- $\alpha$ -methyl benzylamine was replaced by (R)- $\alpha$ -methyl benzylamine in the synthesis of the part A compound. The title compound was obtained in 67% yield (66 mg) overall. [M + H]<sup>+</sup> = 471.2

#### Example 127

in MeOH (2 mL) was stirred at RT for 4 h. NaBH<sub>4</sub> (12 mg, 0.0294 mmol) was added and the reaction was stirred at RT for 30 min. The reaction mixture was then concentrated in vacuo, diluted with CH<sub>2</sub>Cl<sub>2</sub> (2 mL), and filtered through  
5 cotton. TFA (1 mL) was added to the filtrate and the reaction was stirred at RT overnight. The reaction mixture was concentrated in vacuo, diluted with EtOAc, washed several times with sat'd. aqueous NaHCO<sub>3</sub>, then with brine. The organic phase was dried (MgSO<sub>4</sub>) and  
10 concentrated in vacuo. The residue was purified by preparative HPLC (YMC ODS 30mm x 250mm reverse-phase column; flow rate = 25 mL/min; 30 min continuous gradient from 50:50 A:B to 100% B, where A = 90:10:0.1 H<sub>2</sub>O:MeOH:TFA and B = 90:10:0.1 MeOH:H<sub>2</sub>O:TFA) to provide the title

A mixture of Example 7 Part A (40 mg, 0.13 mmol), D-alanine tert-butyl ester hydrochloride (31 mg, 0.17 mmol), Et<sub>3</sub>N (6 drops) and 4A molecular sieves in MeOH (2 mL) was stirred at RT for 4 h. NaBH<sub>4</sub> (15 mg, 3 equiv) was added and the mixture was stirred at RT for 30 min, then concentrated *in vacuo*. The residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (2 mL) and filtered. To the filtrate in a vial were added 4-phenoxybenzaldehyde (77 mg, 0.39 mmol) and NaBH(OAc)<sub>3</sub> (138 mg, 0.65 mmol). The reaction was stirred at RT for 18 h. The reaction mixture was chromatographed on SiO<sub>2</sub> using hexanes/EtOAc (9:1 to 4:1) to obtain the pure tert-butyl ester. This material was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (2 mL) and TFA (1 mL) was added slowly. The solution was stirred at RT overnight, then was concentrated *in vacuo*. The residue was redissolved in CH<sub>2</sub>Cl<sub>2</sub> and filtered through solid NaHCO<sub>3</sub> to remove residual TFA. This solution was further diluted with CH<sub>2</sub>Cl<sub>2</sub>, washed with 1 M aq NaHSO<sub>4</sub> and brine, dried (MgSO<sub>4</sub>), filtered and concentrated *in vacuo* to obtain the title compound (9.1 mg, 12%). The organic layer was separated and concentrated in vacuo. The residue was distilled (Buchi Kugelrohr; bp = 115°C @ 10 mm Hg) to provide 2-methoxyphenyl chloroformate (1.5g; 50%) as a clear oil.

B.

25

A solution of the amino-t-butyl ester (20 mg, 0.05 mmol),

(prepared as described in Example 7 Part B),  
2-methoxyphenyl chloroformate (8 mg, 0.05 mmol; prepared  
as above) and polyvinylpyridine (Aldrich; 16 mg, 0.3  
mmol) in  $\text{CH}_2\text{Cl}_2$  (1 mL) was stirred for 30 min at RT.

5 Amine resin WA21J (Supelco; 200 mg) was added and the  
mixture was stirred at RT for 30 min in order to remove  
unreacted chloroformate. The reaction mixture was  
filtered and concentrated in vacuo to give the desired 2-  
methoxyphenyl carbamate-ester.

10 The ester was treated with a solution of 30% TFA in  
 $\text{CH}_2\text{Cl}_2$  (5 mL) overnight. Volatiles were removed in vacuo  
to give the crude acid. This material was purified via  
solid-phase extraction using an anion exchange column  
(CHQAX13M6 column; United Technologies; 3 g of sorbent in  
15 a 6 mL column) by the exemplary procedure outlined below.

1) The column was conditioned with MeOH (10 mL) and  $\text{CH}_2\text{Cl}_2$   
(10 mL).

20 2) The crude acid was dissolved in a minimal volume of  
 $\text{CH}_2\text{Cl}_2$  and loaded onto the SAX column.

3) The cartridge was washed with  $\text{CH}_2\text{Cl}_2$  (10 mL),  
 $\text{CH}_2\text{Cl}_2/\text{MeOH}$  (10 mL of a 4:1  $\text{CH}_2\text{Cl}_2:\text{MeOH}$  solution).

25

4) The product was eluted with  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  (10 mL of a 4:1  
 $\text{CH}_2\text{Cl}_2:\text{MeOH}$  solution).

The product-containing fractions were concentrated  
30 in vacuo on a Speed Vac to afford title compound as an

indicated that the purity of the product was 90%. In  
addition LC/MS gave the correct molecular ion  $[(M+H)^+ =$   
517.3] for the desired title compound.

5 in *vacuo* using a Speed Vac for 16 h to afford the  
purified product (20 mg, 80%) as a solid. Reverse phase  
HPLC analysis (YMC S5 ODS 4.6 x 33 mm column, continuous

Example 140

Benzyl chloroformates were synthesized by the  
20 following general procedure, as exemplified by m-methoxy  
benzyl chloroformate:

A.

25

To a solution of 3-methoxybenzyl alcohol (2.0 g;  
7.24 mmol), N,N-dimethylaniline (0.877 g; 7.24 mmol) in  
anhydrous ether (5 mL) was added phosgene dropwise (3.8  
30 mL of a 1.93 M solution in toluene; 7.3 mmol) at 0°C.  
The reaction mixture was stirred at 0°C for 2 h, after

which solids were filtered off. The filtrate was concentrated *in vacuo* at RT. The crude chloroformate was stripped from anhydrous Et<sub>2</sub>O (2 x 2 mL) and used without further purification in the next reaction. Subsequently  
5 other chloroformates were also prepared using this standard procedure.

B.

10

The title compound was prepared as part of a solution phase library which was run using the following standard procedure.

15 To a suspension of the Example 3 amino acid (trifluoroacetic acid salt)

(25 mg, 0.05 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (1 mL) was added Part A compound (10 mg; 0.05 mmol) and iPr<sub>2</sub>NEt (19.4 mg; 0.15  
20 mmol). After stirring for 30 min at RT, the reaction mixture was concentrated *in vacuo*.

The product was purified via solid-phase extraction using a Varian CHQAX13M6 (anion exchange) column (3 g of sorbent in a 6 mL column) by the procedure outlined  
25 below:

1) The column was conditioned with MeOH (10 mL) and CH<sub>2</sub>Cl<sub>2</sub> (10 mL)

2) The residue was dissolved in a minimal volume of  $\text{CH}_2\text{Cl}_2$  and loaded onto the SAX column.

3) The cartridge was washed successively with  $\text{CH}_2\text{Cl}_2$  (10 mL), 20%  $\text{MeOH}/\text{CH}_2\text{Cl}_2$  (10 mL).

4) The product was eluted with a solution of 20%  $\text{MeOH}/\text{CH}_2\text{Cl}_2$  (10 mL).

10 The product-containing fractions were concentrated in vacuo using a Speed Vac to afford the title compound. Reverse Phase HPLC analysis using standard conditions indicated that the product purity was 90%. In addition, LC/MS (electrospray) gave the correct molecular ion  
15  $[(M+H)^+ = 531.3]$  for the desired title compound.

Example 141

A.

A solution of 4-(benzyloxy)phenol (2.0 g; 9.99 mmol), N,N-dimethylaniline (1.21 g; 9.99 mmol), phosgene (5.2 mL of a 1.95 M solution in toluene; 10 mmol) and a catalytic amount of DMF in chlorobenzene (5 mL) was heated at 80°C in a pressure tube for 2.5 h. The mixture  
30 was allowed to cool to RT. The upper clear solution was

separated and concentrated *in vacuo* to give the crude title aryl chloroformate as crystals (2 g crude product).

B.

5

To a mixture of the Part A chloroformate (184 mg, 0.70 mmol) in  $\text{CH}_2\text{Cl}_2$  (5 mL) and polyvinylpyridine (Aldrich; 315 mg, 1 mmol) was added a solution of the amino-tert-butyl ester (280 mg, 0.66 mmol)

(prepared as described in Example 7 Part B), in  $\text{CH}_2\text{Cl}_2$  (5 mL). The reaction was stirred at RT for 15 min. Resin-bound amine (WA21J, Supelco; 150 mg) was added to the mixture. The reaction mixture was stirred for another 15 min. The resin-bound amine and polyvinylpyridine were filtered off and the filtrate was concentrated *in vacuo* to give the crude product. The crude product was chromatographed ( $\text{SiO}_2$ ; hexane/EtOAc 1:4) to provide title compound (0.30 g, 70%).

C.

25

A solution of Part B compound (75 mg; 0.42 mmol) in 20 ml MeOH was hydrogenated in the presence of 20 mg of 10% Pd/C under an atmosphere of  $\text{H}_2$  (balloon) for 24 h.

The palladium catalyst was removed by filtration and the filtrate was concentrated *in vacuo* to give the crude title t-butyl ester (240 mg, 90%) which was used without further purification in the next step.

5

D.

10        The solution of Part C phenol-tert-butyl ester (50 mg; 0.089 mmol), catalytic Bu<sub>4</sub>NBr (1.5 mg, 0.0047 mmol), aq NaOH (0.7 mL of a 1 M solution) and isopropanol (2 mL) in a pressure tube was cooled to -50°C. Freon gas was bubbled into the solution for 1 min. The tube was sealed  
15        and heated to 80°C for 12 h. The mixture was extracted with EtOAc (3 x 10 mL). The combined organic extracts were washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated *in vacuo* to give an oil, which was then treated with a solution of 30% TFA in CH<sub>2</sub>Cl<sub>2</sub> overnight. Volatiles were  
20        removed *in vacuo* and the residue was purified using preparative HPLC (YMC S5 ODS 30 x 250mm reverse phase column; 30 minute continuous gradient from 70:30 A:B to 100% B, where A = 90:10:0.1 H<sub>2</sub>O:MeOH:TFA, and B = 90:10:0.1 MeOH:H<sub>2</sub>O:TFA) to afford the desired title  
25        product (14 mg; 28%). Reverse Phase HPLC analysis indicated that the product purity was 97%. In addition LC/MS (electrospray) gave the correct molecular ion [(M+H)<sup>+</sup> = 553.1] for the desired compound.

To a solution of the secondary amine-ester (2.1 g;  
5.52 mmol)

in  $\text{CH}_2\text{Cl}_2$  (10 mL) was added 4-methylphenyl chloroformate (0.79 mL; 5.52 mmol) and polyvinyl pyridine (Aldrich; 1.74 g; 16.5 mmol). The mixture was stirred at RT for 5 15 min; at this point TLC showed that starting material had been consumed. The solution was filtered, concentrated *in vacuo*, and the residue was chromatographed ( $\text{SiO}_2$ ; hex:EtOAc 4:1) to provide the pure carbamate-ester (2 g). This was dissolved in a mixture of THF (10 mL), MeOH (1 mL) and aqueous LiOH (8 mL of a 1 10 M solution). The solution was stirred at RT overnight, then acidified to pH 3 with excess aqueous 1 M HCl. The solution was extracted with EtOAc (2 x 50 mL). The combined organic extracts were washed with  $\text{H}_2\text{O}$  (2 x 50 15 mL) and brine (50 mL), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated *in vacuo* to provide title compound as a white solid (1.75 g; 63%).  $[\text{M} + \text{H}]^+ = 501.2$

$[\text{M} + \text{H}]^+ = 501.2$ ;  $^1\text{H}$  NMR (400 MHz;  $\text{CDCl}_3$ ):  $\delta$  7.93-7.99 (m, 2H), 7.38-7.43 (m, 3H), 7.23 (q, 1H,  $J = 8$  Hz), 7.02-7.12 (m, 3H), 6.98-7.02 (m, 2H), 6.82-6.89 (m, 2H), 4.71 (s, 1H), 4.64 (s, 1H), 4.25 (t, 2H,  $J = 7$  Hz), 4.07 (s, 2H), 2.90-2.98 (m, 2H), 2.37 (s, 3H), 2.29 (s, 3H)

Example 230

To a 0°C solution of the secondary amine (3.0 g; 7.9 mmol)

in  $\text{CH}_2\text{Cl}_2$  (45 mL) were successively added pyridine (0.8 mL; 9.9 mmol) and 4-methoxyphenyl chloroformate (1.3 mL; 8.7 mmol). The reaction was stirred at 0°C for 3 h, at which point starting material had been consumed (by analytical HPLC). The reaction solution was washed with aqueous HCl (2 x 25 mL of a 1 M solution), brine (2x), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated *in vacuo*. The crude product was chromatographed ( $\text{SiO}_2$ ; stepwise gradient from 4:1 to 3:7 hex:EtOAc) to provide the desired carbamate-ester (4.2 g; 100%). The ester was dissolved in THF:MeOH:H<sub>2</sub>O (50 mL of a 3:1:1 solution) and LiOH.H<sub>2</sub>O (0.5 g; 11.9 mmol) was added. The solution was stirred overnight at RT. Starting material was still present by HPLC. More LiOH.H<sub>2</sub>O (0.2 g; 4.8 mmol) was added and the mixture was briefly heated to solubilize the LiOH, then stirred at RT for 4 h. The reaction was complete at this point, and the mixture was acidified to pH 3 with excess aqueous 1 M HCl, then organic solvents were removed in *vacuo*. The residual aqueous phase was extracted with EtOAc (3 x 50 mL). The combined organic extracts were successively washed with H<sub>2</sub>O and brine (50 mL each), dried ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated *in vacuo* to give title compound as a colorless solid (3.07 g; 75%).

$[\text{M} + \text{H}]^+ = 517.2$ ;  $^1\text{H}$  NMR (400 MHz;  $\text{CDCl}_3$ ):  $\delta$  7.96–7.98 (m, 2H), 7.4–7.45 (m, 3H), 7.2–7.3 (m, 2H), 7.0–7.1 (m, 2H), 6.8–7.0 (m, 4 H), 4.65 (s, 1H), 4.55 (s, 1H), 4.20–4.24 (m, 2H), 4.02 (s, 2H), 3.77 (s, 3H), 3.00 (s, 2H), 2.38 (s, 3H).

- 25 compound (60 mg; 0.10 mmol),  $\text{Bu}_4\text{NBr}$  (0.32 mg, 0.001 mmol), aqueous NaOH (0.5 mL of a 1 M solution; 0.5 mmol) and isopropanol (1 mL) in a pressure tube was cooled to  $-50^\circ\text{C}$ . Freon gas was bubbled into the solution for 1 min. The tube was sealed and heated to  $80^\circ\text{C}$  for 12 h.

The mixture was extracted with EtOAc (3 x 10 mL). The combined organic extracts were washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated *in vacuo* to give the crude difluoromethoxy ether-tert butyl ester as an oil. The crude ester was then treated with a solution of 30% TFA in CH<sub>2</sub>Cl<sub>2</sub> overnight. Volatiles were removed in *vacuo* and the residue was purified using preparative reverse-phase HPLC (as in Example 127, except that the continuous gradient used was from A:B 70:30 to 100% B) to afford two products, the desired title difluoromethoxy ether-acid (13 mg; 23%) and the phenol-acid set out below (32 mg; 63%). Reverse phase HPLC analysis using standard conditions indicated that the product purity was >92%. In addition LC/MS (electrospray) gave the correct molecular ion [(M+H)<sup>+</sup> = 553.2 and 503.2 respectively] for the two compounds.

The mixture was stirred at RT for 14 h and then acidified to ~pH 2 with 1.0 M aqueous  $\text{H}_3\text{PO}_4$  solution. EtOAc (30 mL) was added, and the organic phase was washed with water (15 mL) and brine (15 mL), dried ( $\text{MgSO}_4$ ) and concentrated in vacuo. The residue was chromatographed ( $\text{SiO}_2$ ; 4% MeOH/ $\text{CH}_2\text{Cl}_2$ ) to give the title tetrazole (35 mg; 38%) as a white foam. A.

A mixture of 5-methoxy-2-methyl aniline (5.0 g; 36  
5 mmol), HCl (7.6 mL of a 12 M solution; 91 mmol) and H<sub>2</sub>O  
(11 mL) was heated at 60°C for 15 min until complete  
dissolution had occurred. The reaction was cooled to 0°C  
and an aqueous solution of NaNO<sub>2</sub> (2.5 g; 36 mmol) was  
added dropwise (internal temperature ≤ 7°C). The reaction  
10 was stirred at 0°C for 30 min and a 0°C solution of HBF<sub>4</sub>  
(5.3 mL of a 48% solution; 40 mmol) was added cautiously.  
The reaction was stirred at 0°C for 20 min, and the  
resultant brown solid was filtered, washed with ice water  
(3 x 10 mL) and H<sub>2</sub>O (2 x 10 mL). The solid was dried  
15 under high vacuum for 20 h, then heated (heat gun) until  
evolution of BF<sub>3</sub> (white fumes) had ceased. The resulting  
brown oil was partitioned between EtOAc and H<sub>2</sub>O. The  
organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>), concentrated in vacuo  
and distilled by Kugelrohr to give 3-fluoro-4-methyl  
20 anisole (1.6 g; 31%) as a colorless oil.

B.

25 To a -70°C solution of 3-fluoro-4-methyl anisole  
(1.62 g; 11.6 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (10 mL) was added dropwise  
BBR<sub>3</sub> (10 mL; 12 mmol). The reaction mixture was stirred  
at -70°C for 10 min, then allowed to warm to 0°C and  
stirred at 0°C for 2 h. The reaction was allowed to warm  
30 to RT and concentrated in vacuo and the residue was  
partitioned between H<sub>2</sub>O and EtOAc. The organic phase was  
washed with H<sub>2</sub>O, dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated in vacuo  
to give 3-fluoro-4-methyl phenol (1.1 g; 75%) as an oil.

C.

20           3-chloro-4-methyl phenyl chloroformate (600 mg; 45% overall for 2 steps) was synthesized from 3-chloro-4-methyl anisole (1.0 g) using the same route (BBr<sub>3</sub>-mediated methyl ether cleavage followed by treatment with phosgene) as above.

25                   3-bromo-4-methyl-phenyl chloroformate

To a 0°C mixture of 3-bromo-4-methyl aniline (5 g; 27 mmol) and H<sub>2</sub>SO<sub>4</sub> (5.5 mL of a 16 M solution) in H<sub>2</sub>O (7.5 mL) was added dropwise a solution of aqueous NaNO<sub>2</sub> (1.93 g; 28 mmol in 7.5 mL H<sub>2</sub>O). The reaction was stirred at 0°C for 30 min, then was heated at 50°C for 2 h, then was cooled to RT and extracted with EtOAc (2x). The combined organic extracts were washed with H<sub>2</sub>O, dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated in vacuo to give 3-bromo-4-methyl phenol (1.72 g; 34%) as an oil. This phenol was converted to 3-bromo-4-methyl phenyl chloroformate (1.9 g; 82%) using the same procedure (phosgene/ dimethylaniline/heat) as for 3-fluoro-4-methyl phenyl chloroformate above.

2-Methoxyphenyl chloroformate (1.5 g) and 3-methoxyphenyl chloroformate (1.5 g) were both synthesized in the same way as for 3-fluoro-4-methyl phenyl chloroformate (phosgene/dimethylaniline/heat) from 2-methoxyphenol (2 g) and 3-methoxyphenol (2 g) respectively.

A solution of this crude material and LiOH.H<sub>2</sub>O (5 g; 120 mmol) in MeOH:H<sub>2</sub>O (100 mL of a 9:1 mixture) was stirred at RT overnight. Volatiles were removed in vacuo, and the residue was partitioned between excess aqueous 1 M HCl and EtOAc (aqueous layer pH~3). The aqueous phase was extracted with EtOAc (2x).
